

Hi! I'm

Ihsanul Hadi Alghifari

Mobile Flutter Developer

ABOUT

Informatics Engineering graduate focused on Flutter mobile development, with experience building production-ready apps. Backed by Android/Kotlin expertise and a deep learning background in YOLO-based face detection from my undergraduate thesis.

Education

Aug 2022 - Dec 2025
Universitas Sriwijaya
Informatics Engineering

Experience

Sep 2024 - Jan 2025
Bangkit 2024 Batch 2 (MSIB Batch 7)
Mobile Developer Learning Path

Jun 2024 - Aug 2024
Telkom Indonesia (Witel jambi)
Access Service Operation

PROJECT

A production-ready event and digital ticket management platform that streamlines registration, dynamic ticket distribution, and secure real-time attendance tracking using QR codes and GPS geofencing. Self-initiated project.

My Contribution & Impact

- Built a full-stack solution using Flutter/BLoC (Feature-First Clean Architecture) with a Node.js/Express backend and Prisma ORM.
- Developed a dynamic e-ticket engine with bulk email dispatch using Sharp and Cloudinary.
- Implemented QR scanning and GPS geofencing for secure, fraud-resistant attendance validation.
- Integrated Midtrans for automated pay-as-you-go email quota top-up and monetization.

PROJECT

Outcome

Fully developed and launched the application, successfully implementing advanced features such as dynamic QR attendance, geofencing, and reliable bulk email delivery. The app is now live and published on the Google Play Store

What I Learned

This project deepened my understanding of scalable Feature-based Clean Architecture in Flutter with BLoC, complex Node.js backend workflows, and secure third-party API integration (Midtrans, Cloudinary) with relational data management using Prisma ORM and PostgreSQL.

Tools

Rumah Jahit Alya

PROJECT

A production-ready Flutter ERP app that digitalizes tailoring business operations by unifying POS, Inventory, and Payroll into a single cross-platform system with real-time Firestore sync. Self-initiated project.

My Contribution & Impact

- Built a unified Flutter ERP integrating POS, Inventory, and Payroll modules for real business operations.
- Implemented Riverpod for reactive state management and GoRouter for persistent UI states and independent navigation stacks across modules.
- Engineered a transaction system using Firestore Write Batches to automate stock updates, SPK generation, and real-time wage calculation.

Rumah Jahit Alya

Outcome

Deployed to a real tailoring business client, enabling automated POS, real-time stock control, auto-generated SPK, and payroll in one system.

What I Learned

This project deepened my understanding of scalable multi-module Flutter architecture using Riverpod, Firestore Write Batches for maintaining data consistency across interdependent operations, and the full cycle of production app development from gathering client requirements to live deployment.

Tools

Dart

Flutter

Firebase

Riverpod

Small Face Detection with YOLOv11

Developed an optimized small-face detection system using YOLOv11 and computer vision techniques, focusing on improving detection performance in low-resolution and challenging scenarios.

My Contribution & Impact

- Designed a custom detection head architecture tailored for small-face detection
- Optimized inference performance using SAHI with grid search strategy
- Enhanced image quality using Real-ESRGAN 2× super-resolution
- Built an end-to-end detection pipeline from preprocessing to deployment

Small Face Detection with YOLOv11

Outcome

Achieved improved small-face detection accuracy through model tuning and super-resolution enhancement, deployed as an interactive web-based system.

What I Learned

Gained hands-on experience in advanced object detection, model optimization, slicing, and inference acceleration techniques, as well as end-to-end AI system deployment.

Tech Stack

YOLOv11 · SAHI · Real-ESRGAN · PyTorch · Python · OpenCV · Streamlit

Repository

DUIT ONLEN.

A mobile application prototype integrating liveness detection to enhance face authentication security through real-time AI verification.

My Contribution & Impact

- Designed intuitive and secure UI/UX flow
- Developed the Android app using Kotlin and Jetpack Compose
- Integrated a machine learning liveness detection model for real-time verification
- Helped deliver a functional AI-powered authentication prototype

DUIT ONLEN.

Outcome

Delivered a functional real-time face verification prototype that strengthened authentication security through integrated anti-spoof detection.

What I Learned

Gained experience in integrating deep learning models into mobile applications, bridging AI systems with Android architecture, and designing secure, user-centered authentication flows.

Tools

Kotlin

Jetpack
compose

Figma

Dashboard Tracker

A web-based dashboard system designed to monitor and evaluate intern performance, enabling mentors to track submissions, monitor progress, and manage contribution records efficiently.

My Contribution & Impact

- Developed backend logic using Laravel with MVC architecture
- Designed and managed relational database schema using SQLite
- Implemented CRUD operations and server-side validation for intern performance data
- Integrated backend with React frontend using Inertia.js for seamless data handling

Dashboard Tracker

Outcome

Delivered a structured and efficient dashboard system with smooth backend–frontend integration, improving data organization and monitoring workflow.

What I Learned

Gained hands-on experience in full-stack integration using Laravel, React, and Inertia.js, including database schema design, relational data management, and managing state and data flow between backend and frontend, while building maintainable and well-structured web application architecture.

Tools

Laravel

php

React
